

# Increase your grinding capacity by up to 40% by converting your 11-9 or 1109 grinder to a **DIXIE 11-9/10.**

11-9 Feedscrew

11-9/10 Feedscrew

The widely used model 11-9 and 1109 meat grinders utilize an 11" diameter plate and a 9" diameter feedscrew. It is our theory that it is often the size of the feedscrew, not the size of the plate, that limits the capacity of the grinder. Our 11-10 and 11-10 IN-LINE grinders, with their 11" diameter plates and 10.5" diameter feedscrews, have proven this theory. You can add this 11-10 technology to your current 11-9 or 1109 grinder by purchasing our 11-9/10 conversion kit. A fluted adapter bolts to your existing hopper and allows for the addition of the 11-10 head. In addition to being bigger and longer than the 11-9 or 1109 heads, the 11-10 head also features 19 machined spiral flutes and bigger, more durable 4 TPI ACME threads. The special 11-9/10 feedscrew is available in several custom designs for grinding different products and for all of the common length and drive type configurations. It uses standard **DIXIE** 11" cutting parts and high-production plates, which you may be using already. It is available in single, double, and triple plate configurations and can be equipped with our exclusive BCA-2 Bone Collection Assembly. For more information on how to get the most out of your grinder, call us at toll free at 1-800-745-0586.
